

Growth Velocity & Fleet Health Diagnostics

System Growth vs. Asset Utilization (2024-2026)

The Growth KPI: We recommend quantifying growth using Total Billed Ride Minutes (Year-over-Year) to account for seasonal weather changes, as revenue is directly driven by trip duration rather than just trip volume.

Current Trajectory: The program is in a period of hyper-growth. In Q2 2026, total billed ride minutes surged by **31.74% YoY** (from 6.5M to 8.5M minutes), pacing perfectly with a **32.14%** increase in total trips.

System Health (Velocity Check): The program is growing at a stable, sustainable rate - neither too fast nor too slow. We verified this by calculating the Asset Utilization rate. Despite the 31% surge in demand, the average load per bike scaled safely (from **2,799 mins/bike** in Q2 2025 to **3,058 mins/bike** in Q2 2026). Indego successfully expanded its active physical fleet (from 2,330 to 2,809 bikes) to absorb the demand shock without causing station stockouts.

Strategic Blueprint: Duration-Optimized Expansion

- **The Duration Paradox:** A Welch's T-Test reveals that standard pedal bikes generate higher duration-based revenue per trip. With 95% confidence, standard bikes generate between **1.38 and 1.59 more minutes per trip** than e-bikes.
- **Customer Segmentation (ANOVA):** A One-Way ANOVA test confirms a massive variance in customer behavior ($F = 19,639, p < 0.001$). Casual "Walk-up" riders average **35.98 minutes** per trip, double the duration of monthly commuters.
- **Execution Plan:** Shift capital expenditure toward the Walk-up leisure segment. Rather than prioritizing dense commuter hubs, executives should expand standard-bike docks along parks, waterfronts, and tourist corridors to capture profitable 35+ minute riders.
